

Final Individual Project

Overview

The Final Individual Project is the final assessment for this course. This project must be completed **individually**. Students will use the same **YRBS_2007.csv** dataset and may choose their own research topic. The project should demonstrate a complete statistical workflow:

research question → data preparation → method → result → interpretation

All activities are conducted online. There will be no regular class meetings during this period. Approved methods are: **ANOVA** and **Regression**.

Dataset and Description of this project can be found [here](#).

1. Project Requirements

Each student must create an individual GitHub repository. The repository must contain all project materials.

Required materials:

- Jupyter notebook(s) and code;
- cleaned or processed data, if used;
- figures and tables;
- one-page infographic summary;
- README file;
- YouTube presentation video link.

The project must include:

- a clear research question;
- clearly defined variables;
- appropriate data cleaning or recoding;
- a suitable statistical method;
- meaningful figures or tables;
- clear interpretation and conclusion.

The one-page summary should not be a text-heavy report page. It should communicate the research question, variables, method, key results, interpretation, and conclusion visually.

2. Presentation Video Requirement

Each student must submit a presentation video of at least **5 minutes**.

The video must:

- be uploaded to both **GitHub** and **YouTube**;
- be linked clearly in the project README.md;
- be conducted in English;
- begin with the student's full name and student ID;
- show the student's face and use the student's real voice;
- explain the one-page summary clearly;
- show and explain the key parts of the code to support your work.
- The video should resemble a short academic presentation. Students should explain naturally and avoid simply reading the text word-for-word.
- AI-generated narration, text-to-speech voice, AI avatar presenters, synthetic voice replacement, and AI-generated speaking overlays are not allowed. Students must use their own real face and real voice.

3. Submission Method

All project materials must be submitted through the student's own **GitHub repository**, including the video. The video must also be uploaded to YouTube and linked in the repository. The `README.md` should clearly include:

```
## Student Information
```

```
Name:
```

```
Student ID:
```

```
## Project Repository
```

```
https://github.com/.....
```

```
## Presentation Video
```

```
https://youtube.com/.....
```

No modifications are allowed after the project submission deadline.

4. Deadline (2026/06/23)

Before the project submission deadline, students must provide their GitHub repository and YouTube links at: [Submission Spreadsheet](#), or

https://docs.google.com/spreadsheets/d/1M_ovTRKYsLRGm8LSkkJi1j051Id1C41-nhScB2lr7Lc/edit?usp=sharing.

5. Grading

Projects will be evaluated based on:

- completeness of the GitHub repository;
- clarity of the research question;
- correctness of the statistical method;
- clarity of the code and workflow;
- quality of the figures and tables;
- quality of the one-page summary;
- quality of the presentation video;
- correctness and clarity of the interpretation.

The project score is determined as follows:

- **30%**: GitHub repository, one-page summary, video link, and overall completeness.
- **70%**: Video recording.
